(57) **ABSTRACT**

A communication device having a display and instructions for displaying a short range wireless function. The instructions can cause the display of a Toolkit homepage in response to a Toolkit application being selected in a homepage of the communication device. In response to the short range wireless function being selected in the Toolkit homepage, status of the short range wireless function on the communication device can be displayed. In response to the short range wireless function being turned on, a short range wireless function menu can be displayed. In response to a pairing option being selected from the displayed short range wireless function menu, menu options for pairing a short range wireless device with the communication device can be displayed.

REMOTE DEVICE PAIRING SETUP

CROSS REFERENCE TO RELATED APPLICATIONS

This application is a continuation of U.S. application Ser. No. 12/916,857, filed on Nov. 1, 2010, which claims priority to U.S. Provisional Application No. 61/365,117, filed on Jul. 16, 2010; said applications are hereby entirely incorporated by reference.

FIELD OF TECHNOLOGY

The present disclosure relates generally to setting-up a short range wireless device. More specifically, the present disclosure relates to a method for pairing a short range wireless device with a communication device.

BACKGROUND

Communication devices are becoming more prevalent and more advanced. Mobile devices can include, but are not limited to, cellular telephones, smart telephones, wireless personal digital assistants (PDAs), and laptop computers with wireless 802.11 or Bluetooth capabilities. These devices can run on a wide variety of networks from data-only networks such as Mobitex® and DataTAC® networks to complex voice and data networks such as GSM/GPRS, CDMA, EDGE, UMTS and CDMA2000 networks. As the technology associated with mobile devices continues to advance, users of these communication devices are becoming more reliant on these communication devices. For example, technology advances are being made with respect to short range wireless devices. In one or more conventional operating systems, the short range wireless device can be a Bluetooth® function.

BRIEF DESCRIPTION OF THE DRAWINGS

Implementations of the present application will now be described, by way of example only, with reference to the attached Figures, wherein:

FIG. 1 is a front view of a communication device in accordance with an exemplary implementation;

FIG. 2 is a block diagram representing a communication device interacting in a communication network in accordance with an exemplary implementation;

FIG. 3 is a screenshot of a Toolkit function menu for a communication device in accordance with an exemplary implementation;

FIG. 4 is a communication device displaying the status of the short range wireless function in accordance with an exemplary implementation;

FIG. 5 is a communication device displaying a menu for activating the short range wireless function of the communication device in accordance with an exemplary implementation;

FIG. 6 is a communication device displaying a menu for setting up one or more short range wireless devices in accordance with an exemplary implementation;

FIG. 7 is a communication device displaying an alternative menu for setting up one or more short range wireless devices in accordance with an exemplary implementation;

FIG. 8 is a screenshot of the Discoverable menu in accordance with an exemplary implementation;

2

FIG. 9 is a communication device displaying an Add Device menu in accordance with an exemplary implementation;

FIG. 10 is a communication device displays a search status window in accordance with an exemplary implementation;

FIG. 11 is a communication device displays a search result window in accordance with an exemplary implementation;

FIG. 12 is a communication device displays a prompt for a passcode in accordance with an exemplary implementation;

FIG. 13 is a communication device displays a confirmation window in accordance with an exemplary implementation;

FIG. 14 is a communication device displaying a completion window in accordance with an exemplary implementation;

FIG. 15 is a communication device displaying a short menu in accordance with an exemplary implementation;

FIG. 16 is a screenshot of the Toolkit function menu providing an indication that there is a paired device in accordance with an exemplary implementation; and

FIGS. 17A and 17B is a flowchart of a method for pairing a short range wireless device with a communication device in accordance with an exemplary implementation.

DETAILED DESCRIPTION

It will be appreciated that for simplicity and clarity of illustration, where appropriate, reference numerals have been repeated among the different figures to indicate corresponding or analogous elements. In addition, numerous specific details are set forth in order to provide a thorough understanding of the implementations described herein. However, it will be understood by those of ordinary skill in the art that the implementations described herein can be practiced without these specific details. In other instances, methods, procedures and components have not been described in detail so as not to obscure the related relevant function being described. Also, the description is not to be considered as limiting the scope of the implementations described herein.

Referring to FIG. 1, a front view of an electronic communication device 100 in accordance with an exemplary implementation is illustrated. As shown, the communication device 100 can have a full QWERTY keyboard 232. Each key of the keyboard 232 can be associated with at least one indicia representing an alphabetic character, a numeral, or a command (such as a space command, return command, or the like). The plurality of the keys having alphabetic characters is arranged in a standard keyboard layout. This standard keyboard layout can be a QWERTY layout (shown in FIG. 1), a QZERTY layout, a QWERTZ layout, an AZERTY layout, a Dvorak layout, a Russian keyboard layout, a Chinese keyboard layout, or other similar layout, as well as reduced keyboard layouts. These standard layouts are provided by way of example and other similar standard layouts are considered within the scope of this disclosure. The keyboard layout can be based on the geographical region in which the device is intended for sale. In some examples, the keyboard can be interchangeable such that the user can switch between layouts. In other examples, the keyboard is a virtual keyboard provided on a touch screen display (not shown).

As shown, the exemplary communication devices 100 are communicatively coupled to a wireless network 219 as

exemplified in the block diagram of FIG. 2. These figures are exemplary only, and those persons skilled in the art will appreciate that additional elements and modifications may be necessary to make the communication device 100 work in particular network environments. While in the illustrated implementations, the communication devices 100 are smart phones, however, in other implementations, the communication devices 100 may be personal digital assistants (PDA), laptop computers, desktop computers, servers, or other communication device capable of sending and receiving electronic messages.

Referring to FIG. 2, a block diagram of a communication device in accordance with an exemplary implementation is illustrated. As shown, the communication device 100 includes a microprocessor 238 that controls the operation of the communication device 100. A communication subsystem 211 performs all communication transmission and reception with the wireless network 219. The microprocessor 238 further can be communicatively coupled with an auxiliary input/output (I/O) subsystem 228 which can be communicatively coupled to the communication device 100. Additionally, in at least one implementation, the microprocessor 238 can be communicatively coupled to a serial port (for example, a Universal Serial Bus port) 230 which can allow for communication with other devices or systems via the serial port 230. A display 222 can be communicatively coupled to microprocessor 238 to allow for displaying of information to an operator of the communication device 100. When the communication device 100 is equipped with the keyboard 232, the keyboard can also be communicatively coupled with the microprocessor 238. The communication device 100 can include a speaker 234, a microphone, 226, random access memory (RAM) 226, and flash memory 224, all of which may be communicatively coupled to the microprocessor 238. The RAM 226 can be a non-transitory computer readable medium and can include processor executable instructions and data structures that implement aspect of the subject innovation. The flash memory 224 can be configured to hold processor readable instructions and data that implement aspects of the subject innovation. Other similar components may be provided on the communication device 100 as well and optionally communicatively coupled to the microprocessor 238. Other communication subsystems 240 and other communication device subsystems 242 are generally indicated as being functionally connected with the microprocessor 238 as well. An example of a communication subsystem 240 is that of a short range communication system such as Bluetooth® communication module or a WI-FI® communication module (a communication module in compliance with IEEE 802.11b) and associated circuits and components. Additionally, the microprocessor 238 is able to perform operating system functions and enables execution of programs on the communication device 100. In some implementations not all of the above components may be included in the communication device 100. For example, in at least one implementation the keyboard 232 is not provided as a separate component and is instead integrated with a touchscreen as described below.

The auxiliary I/O subsystem 228 can take the form of a variety of different navigation tools 127 (multi-directional or single-directional) such as an optical navigation module or tool as illustrated in the exemplary implementation shown in FIG. 1. In other implementations, a trackball, thumbwheel, a navigation pad, a joystick, touch-sensitive interface, or other I/O interface can be used. The navigation tool 127 can be located on a front surface 170 of the communication device 100 or may be located on any exterior surface of the

communication device 100. Other auxiliary I/O subsystems can include external display devices and externally connected keyboards (not shown). While the above examples have been provided in relation to the auxiliary I/O subsystem 228, other subsystems capable of providing input or receiving output from the communication device 100 are considered within the scope of this disclosure. Additionally, other keys may be placed along the side of the communication device 100 to function as escape keys, volume control keys, scrolling keys, power switches, or user programmable keys, and may likewise be programmed accordingly.

As may be appreciated from FIG. 1, the communication device 100 comprises the lighted display 222 located above the keyboard 232 constituting a user input and suitable for accommodating textual input to the communication device 100. The front face 170 of the communication device 100 has a navigation row 70. As shown, the communication device 100 is of unibody construction, also known as a “candy-bar” design. In alternate implementations, the communication device 100 can be a “clamshell” or a “slider” design.

As described above, the communication device 100 may include the auxiliary input 228 that acts as a cursor navigation tool 127 and which can be also exteriorly located upon the front face 170 of the communication device 100. Its front face location allows the tool to be easily thumb-actuable like the keys of the keyboard 232. An implementation provides the navigation tool 127 in the form of a navigation module having an optical sensor or laser sensor, a capacitive sensor, or both, which can be utilized to instruct two-dimensional or three-dimensional screen cursor movement in substantially any direction, as well as act as an actuator when the optical navigation module is depressed like a button. Other navigation tools 127 can be used, for example, a trackball. The placement of the navigation tool 127 may be above the keyboard 232 and below the display screen 222; here, the navigation tool 127 can avoid interference during keyboarding and does not block the operator's view of the display screen 222 during use.

As illustrated in FIG. 1, the communication device 100 may be configured to send and receive messages. The communication device 100 includes a body 171 which may, in some implementations, be configured to be held in one hand by an operator of the communication device 100 during text entry. The display 222 is included which is located on the front face 170 of the body 171 and upon which information is displayed to the operator during text entry. The communication device 100 may also be configured to send and receive voice communications such as mobile telephone calls. The communication device 100 may also include a camera (not shown) to allow the user to take electronic photographs which can be referred to as photos or pictures.

Furthermore, the communication device 100 is equipped with components to enable operation of various programs, as shown in FIG. 2. In an exemplary implementation, the flash memory 224 is enabled to provide a storage location for the operating system 257, device programs 258, and data. The operating system 257 is generally configured to manage other programs 258 that are also stored in memory 224 and executable on the microprocessor 238. The operating system 257 honors requests for services made by programs 258 through predefined program 258 interfaces. More specifically, the operating system 257 typically determines the order in which multiple programs 258 are executed on the microprocessor 238 and the execution time allotted for each program 258, manages the sharing of memory 224 among

5

multiple programs **258**, handles input and output to and from other device subsystems **242**, and so on. In addition, operators can typically interact directly with the operating system **257** through a user interface usually including the keyboard **232** and display screen **222**. While in an exemplary implementation the operating system **257** is stored in flash memory **224**, the operating system **257** in other implementations is stored in read-only memory (ROM) or similar storage element (not shown). As those skilled in the art will appreciate, the operating system **257**, device program **258** or parts thereof may be loaded in RAM **226** or other volatile memory.

When the communication device **100** is enabled for two-way communication within the wireless communication network **219**, the communication device **100** can send and receive signals from a mobile communication service. Examples of communication systems enabled for two-way communication include, but are not limited to, the General Packet Radio Service (GPRS) network, the Universal Mobile Telecommunication Service (UMTS) network, the Enhanced Data for Global Evolution (EDGE) network, the Code Division Multiple Access (CDMA) network, High-Speed Packet Access (HSPA) networks, Universal Mobile Telecommunication Service Time Division Duplexing (UMTS-TDD), Ultra Mobile Broadband (UMB) networks, Worldwide Interoperability for Microwave Access (WiMAX), and other networks that can be used for data and voice, or just data or voice. For the systems listed above, the communication device **100** may require a unique identifier to enable the communication device **100** to transmit and receive signals from the communication network **219**. Other systems may not require such identifying information. GPRS, UMTS, and EDGE use a smart card such as a Subscriber Identity Module (SIM) in order to allow communication with the communication network **219**. Likewise, most CDMA systems use a Removable Identity Module (RUIM) in order to communicate with the CDMA network. A smart card can be used in multiple different communication devices **100**. The communication device **100** may be able to operate some functions without a smart card, but the communication device **100** will not be able to communicate with the network **219**. A smart card interface **244** located within the communication device **100** allows for removal or insertion of a smart card (not shown). The smart card functions memory and holds key configurations **251**, and other information **253** such as identification and subscriber related information. With a properly enabled communication device **100**, two-way communication between the communication device **100** and communication network **219** is possible.

If the communication device **100** is enabled as described above or the communication network **219** does not require such enablement, the two-way communication enabled communication device **100** is able to both transmit and receive information from the communication network **219**. The transfer of communication can be from the communication device **100** or to the communication device **100**. In order to communicate with the communication network **219**, the communication device **100** in the presently described exemplary implementation is equipped with an integral or internal antenna **218** for transmitting signals to the communication network **219**. Likewise the communication device **100** in the presently described exemplary implementation is equipped with another antenna **216** for receiving communication from the communication network **219**. These antennae (**216**, **218**) in another exemplary implementation are combined into a single antenna (not shown). As one skilled in the art would

6

appreciate, the antenna or antennae (**216**, **218**) in another implementation are externally mounted on the communication device **100**.

When equipped for two-way communication, the communication device **100** functions the communication subsystem **211**. As is understood in the art, this communication subsystem **211** is modified so that the communication subsystem **211** can support the operational needs of the communication device **100**. The subsystem **211** includes a transmitter **214** and receiver **212** including the associated antenna or antennae (**216**, **218**) as described above, local oscillators (LOs) **213**, and a processing module **220**, which in the presently described exemplary implementation is a digital signal processor (DSP) **220**.

It is contemplated that communication by the communication device **100** with the wireless network **219** can be any type of communication that both the wireless network **219** and communication device **100** are enabled to transmit, receive and process. In general, these can be classified as voice and data. Voice communication generally refers to communication in which signals for audible sounds are transmitted by the communication device **100** through the communication network **219**. Data generally refers to all other types of communication that the communication device **100** is capable of performing within the constraints of the wireless network **219**.

The keyboard **232** can include a plurality of keys that can be of a physical nature such as actuable buttons, or they can be of a software nature, typically constituted by virtual representations of physical keys on the display screen **222** (referred to herein as “virtual keys”). The user input can be provided as a combination of the two types of keys. Each key of the plurality of keys has at least one actuable action which can be the input of a character, a command or a function. In this context, “characters” are contemplated to exemplarily include alphabetic letters, language symbols, numbers, punctuation, insignias, icons, pictures, and even a blank space.

In the case of virtual keys, the indicia for the respective keys are shown on the display screen **222**, which in one implementation is enabled by touching the display screen **222**, for example, with a stylus, finger, or other pointer, to generate the character or activate the indicated command or function. Some examples of display screens **222** capable of detecting a touch include resistive, capacitive, projected capacitive, infrared and surface acoustic wave (SAW) touchscreens.

Physical and virtual keys can be combined in many different ways as appreciated by those skilled in the art. In one implementation, physical and virtual keys are combined such that the plurality of enabled keys for a particular program or function of the communication device **100** is shown on the display screen **222** in the same configuration as the physical keys. Using this configuration, the operator can select the appropriate physical key corresponding to what is shown on the display screen **222**. Thus, the desired character, command or function is obtained by depressing the physical key corresponding to the character, command or function displayed at a corresponding position on the display screen **222**, rather than touching the display screen **222**.

While the above description generally describes the systems and components associated with a communication device, the communication device **100** could be another communication device such as a PDA, a laptop computer, desktop computer, a server, or other communication device. In those implementations, different components of the above system might be omitted in order to provide the desired

7

communication device **100**. Additionally, other components not described above may be required to allow the communication device **100** to function in a desired fashion. The above description provides only general components and additional components may be required to enable the system to function. These systems and components would be appreciated by those of ordinary skill in the art. Further, this description references Bluetooth® technology as an example of open wireless technology for exchanging data over short distances. However, this description is not limited to Bluetooth® technology but is broader and includes other short range wireless technology.

Referring to FIG. 3, a screenshot of a Toolkit function menu for a communication device **100** in accordance with an exemplary implementation is illustrated. As shown, the screenshot **300** can be for the homepage of a Toolkit function, e.g., a setup screen, for setting up one or more applications. For example, the applications can be for Email Accounts **302**, BlackBerry Messenger **304**, Instant Messaging **306**, Social Networking **308**, Bluetooth® **310**, WiFi **312**, and AT&T Address Book **314**. As shown, the Bluetooth® **310** icon is highlighted. In addition, the screenshot **300** includes icons for Personalization **316** with associated instructions **318** and for Help and Tutorials **320** with associated instructions **320**. In this screenshot **300**, the Bluetooth® icon **310** is displayed without a checkmark providing an indication that the communication device **100** is not paired with another short range wireless device. If the communication device was paired with one or more short range wireless devices, then the Bluetooth® icon **312** would include a checkmark as shown in FIG. 16. In one or more embodiments, accessing the short range wireless function, for example, the Bluetooth® **310** function can only be accessed through the Toolkit function.

Referring to FIG. 4, a communication device **100** displaying the status of the short range wireless function in accordance with an exemplary implementation is illustrated. The communication device **100** displays the status of the short range wireless function in response to the Bluetooth® icon **310** being selected. As shown, the Bluetooth® function is Off. In one or more conventional operating systems for communication devices, by clicking on the Bluetooth® icon **310**, the Bluetooth® function would be activated, for example, turned on. Such activation can cause problems, such as a user not wanting to activate the Bluetooth® function because the user is concerned about security of the electronic device. As shown, the communication device **100** can display the status of the Bluetooth® function and a dropdown menu **402** for activating the Bluetooth® function. As shown in FIG. 4, there are no short range wireless devices paired with the communication device **100**.

Referring to FIG. 5, a communication device **100** displaying a menu for activating the short range wireless function, e.g., Bluetooth® function, of the communication device in accordance with an exemplary implementation is illustrated. The communication device **100** can display the menu for activating the short range wireless function in response to the dropdown menu **402** of FIG. 4 being selected. The user can use the menu for activating the short range wireless function to turn on the short range wireless function. For example, by placing a cursor (not shown) on the menu **402** and selecting an "ON" option **502** or if the menu items are linked, the user can use the navigation tool **127** to highlight and select the "ON" option **502**. Similarly, if one or more short range wireless devices are activated, the user can use the menu to turn the short range wireless function off. For example, by placing a cursor (not shown)

8

on and selecting an "OFF" option **504** or if the menu items are linked, the user can use the navigation tool **127** to highlight and select the "OFF" option **504**.

Referring to FIG. 6, a communication device **100** displaying a menu for setting up one or more short range wireless devices in accordance with an exemplary implementation is illustrated. The communication device **100** can display the menu in response to the dropdown menu **402** of FIG. 4 being selected when there are no paired short range wireless devices. As shown, the display can include a Discoverable dropdown menu **602** and an Add New Device menu **604**. The Discoverable dropdown menu **602** allows the communication device **100** to be discovered by other short range wireless devices that are capable of detecting a pairing signal. The Add New Device menu **604** allows a user to pair the communication device **100** with another short range wireless device.

Referring to FIG. 7, a communication device **100** displaying an alternative menu for setting up one or more short range wireless devices in accordance with an exemplary implementation is illustrated. The communication device **100** can display the menu in response to the dropdown menu **402** of FIG. 4 being selected when there are paired short range wireless devices. As shown, the display can include a Discoverable dropdown menu **602** and an Add New Device menu option **604**. The listing of paired short range wireless devices **702** includes icons for Bob's Computer **704** (for example, a previously paired computer such as a computer including the BlackBerry® Enterprise Solution), Eric's BlackBerry 8900 **706**, PLA-LT **708** (a name of a laptop), Jack's Phone **710**, and Bob's Headset **712**.

Referring to FIG. 8, a screenshot **800** of the Discoverable menu in accordance with an exemplary implementation is illustrated. This screenshot **800** can be displayed in response to the Discoverable dropdown menu **602** of FIG. 6 or FIG. 7 being selected. As shown, the Discoverable menu **802** can include a No option **804**, a 2 Minutes option **806**, and a Yes option **808**. The No option **802** can be highlighted. The Discoverable function allows the communication device **100** to be found by another short range wireless device, but does not require the two devices to be connected. For example, the two devices may not be compatible or the users of the two short range wireless devices may not want to connect. The No option **802** can prevent the communication device **100** from being discovered by other short range wireless devices. The 2 Minutes option **806** can allow the communication device **100** to be discovered by other short range wireless devices for two minutes. In one or more implementations, the user can adjust the amount of time the communication device **100** can discover other short range wireless devices. The predetermined time limit, for example, two minutes, is a security measure. Alternatively, the user can select the Yes option **808** if the user does not want to limit the time or can manually end the discover function by selecting the No option **804**.

Referring to FIG. 9, a communication device **100** displaying an Add Device menu **902** in accordance with an exemplary implementation is illustrated. The communication device **100** can display the Add Device menu **902** in response to the Add New Device menu option **604** in FIG. 7 being selected. As shown, an Add Device menu **902** can include the options of Search **904**, Listen **906**, and Cancel **908**. The Search option **904** can allow the communication device **100** to search for other short range wireless devices. The Listen option **906** can allow the

communication device **100** to be found by other short range wireless devices. The Cancel option **908** can cancel the Add New Device function.

Referring to FIG. **10**, a communication device **100** displays a search status window **1002** in accordance with an exemplary implementation is illustrated. The communication device **100** can display the search status window **1002** in response to the Search option **904** being selected in FIG. **9**. As shown, the search status window **1002** can show the status of the search along with a percentage bar **1004** and a Cancel option **908**. The percentage bar **1004** can provide an indication of the search status, for example 75% complete. The percentage bar **1004** can indicate various levels of completion. The percentage bar **1004** allows for quick identification of the level and the specific numerical amount provides a precise level. Additionally, the percentage bar **1004** can be embodied in other representations, such as a rotating circle having a percentage filled and the like. The status window **1002** can provide an indication of the number of short range wireless devices that have been discovered during the search, for example three devices. The Cancel option **908** can cancel the Add New Device function.

Referring to FIG. **11**, a communication device **100** displays a search result window **1102** in accordance with an exemplary implementation is illustrated. The communication device **100** can display the search result window **1102** in response to a search being completed. As shown, the search result window **1102** can display a list of the short range wireless devices that have been found during the search along with a Cancel option **908**. The list of found devices includes Laura's Computer **1104**, Smith's Headset **1106**, Jill's Computer **1108**, and Scott's Phone **1110**. The Cancel option **908** can cancel the Add New Device function.

Referring to FIG. **12**, a communication device **100** displays a prompt for a passcode in accordance with an exemplary implementation is illustrated. The communication device **100** can display the prompt **1204** in response to a device being selected (not shown) from the list of found devices from the result window **1102** of FIG. **11**. As shown, the user can be prompted to "Enter A Numeric Passkey" **1202**. The numeric passkey can be a passcode or password that is associated with a found device. The user can enter the numeric passkey in a prompt **1204**. For example, a user can use a physical keyboard or a touchscreen keyboard to enter the numeric passkey in the Enter A Temporary Numeric Passkey prompt **1204**.

Referring to FIG. **13**, a communication device **100** displays a confirmation window **1302** in accordance with an exemplary implementation is illustrated. The communication device **100** can display the confirmation window **1302** prompting the user to confirm the accuracy of the temporary numeric passkey being entered in the Enter A Numeric Passkey prompt **1204** of FIG. **12**. As shown, the confirmation window **1302** can display the entered passkey **1304** (for example, 767 550) with a Yes option **1306** or a No option **1308**. If the entered passkey **1304** is accurate the user can select the Yes option **1306** and if the entered passkey **1304** is not accurate the user can select the No option **1308**. If the user enters the No option **1208**, the prompt for entering a passcode **1204** of FIG. **12** can be displayed.

Referring to FIG. **14**, a communication device **100** displaying a completion window **1402** in accordance with an exemplary implementation is illustrated. The communication device **100** can display the completion window **1402** in response to the pairing being complete. The completion window **1402** can include a message informing the user that the pairing was successful is displayed, for example, "Pair-

ing Complete! Headset connected." In addition, the new pairing can be displayed in the list of paired devices, for example, Smith's Headset **1404** is displayed in the list. The newest pairing **1404** can be highlighted to provide an indication of the new pairing. The newest pairing can include a checkmark showing that the device was added.

Referring to FIG. **15**, a communication device **100** displaying a short menu **1504** in accordance with an exemplary implementation is illustrated. The communication device **100** can display the short menu **1504** in response to a paired device being selected from the list of paired devices. As shown, Jack's Phone **1502** is the selected paired device. The short menu **1504** or graphical short context menu can include a disable option **1506**, an edit option **1508**, and a more option **1510**. The disable option **1506**, when selected, can cause the paired device to be inactive. The edit option **1508**, when selected, can allow the user to rename the paired device. The more option **1510**, when selected, can cause a menu listing additional menu options associated with the pairing to be displayed.

Referring to FIG. **16**, a screenshot **1600** of the Toolkit function menu providing an indication that there is a paired device in accordance with an exemplary implementation is illustrated. This screenshot **1600** can be displayed when the Toolkit function is accessed and there is a paired short range wireless device or after a short range wireless device was just paired with the communication device. As shown, the screenshot **1600** provides an indication that a short range wireless device is paired with the communication device **100** by displaying a checkmark on the Bluetooth® icon **1602**. In one or more implementations, other indicators can be used to indicate that a short range wireless device is paired with the communication device, for example, the indicator can include coloring the icon, changing the background color of the icon, graying an indicative icon, and the like.

Referring to FIG. **17**, a flowchart of a method **1700** for pairing a short range wireless device with a communication device in accordance with an exemplary implementation is illustrated. The exemplary method **1700** is provided by way of example, as there are a variety of ways to carry out the method. In one or more implementations, the method **1700** can be performed by the microprocessor **238** of the communication device **100**. The method **1700** can be executed or otherwise performed by one or a combination of various systems. The method **1700** described below can be carried out using the communication devices and communication network shown in FIGS. **1** and **2** by way of example, and various elements of these figures are referenced in explaining exemplary method **1700**. Each block shown in FIG. **17** represents one or more processes, methods or subroutines carried out in exemplary method **900**. The exemplary method **1700** may begin at block **1702**.

At block **1702**, a Toolkit application can be accessed. For example, a user can select the Toolkit application displayed on the homepage of the communication device **100**. In response to the Toolkit application being selected, the microprocessor **238** can cause a Toolkit application menu to be displayed on the display **222** of the communication device as shown in FIG. **3**. The Toolkit application is the only means on the communication device **100** to access the short range wireless function. Once accessed, the user can perform several functions, including, but not limited to, activating the short range wireless function, pairing a short range wireless device with the communication device **100**, or both. After accessing the Toolkit application, the method **1700** can proceed to block **1704**.

11

At block 1704, the short range wireless function can be selected from the displayed Toolkit application menu. For example, a user can select the Bluetooth® function from the Toolkit application menu displayed on the communication device 100. In response to the short range wireless function being selected, the microprocessor 238 can cause the status of the short range wireless function to be displayed on the display 222 of the communication device as shown in FIG. 4. After the short range wireless function is selected, the method 1700 can proceed to block 1706.

At block 1706, the short range wireless function can be activated. For example, using a navigation tool 127 a user can select the menu 402 as shown in FIG. 4. In response to the menu 402 being selected, the microprocessor 238 can cause the display of a menu with an On option 502 and an Off option 504 on the display 222 of the communication device as shown in FIG. 5. In response to the user selecting the On option 502, the microprocessor 238 can activate the Bluetooth® function. In order to activate the Bluetooth® function, the user must make a selection. In other words, by accessing the Bluetooth® function, the Bluetooth® function is not automatically activated. This is a security measure to ensure that the user desires to have the Bluetooth® function active. For example, if the user is concerned about security such as improper access to the communication device 100 or messages associated with the communication device 100, the user does not have to turn off the Bluetooth® function once the Bluetooth® function was selected from the Toolkit application. In response to the user selecting the Off option 504, the microprocessor 238 can de-activate the Bluetooth® function. After the Bluetooth® function is activated, the method 1700 can proceed to block 1708.

At block 1708, the Bluetooth® pairing options can be displayed. For example, in response to the Bluetooth® function being activated, the microprocessor 238 can cause the display of a pairing menu on the display 222 of the communication device as shown in FIG. 6. The pairing menu can include a Discoverable option 602 and Add New Device option 604. Using a navigation tool 127 a user can select an option. In the event the user selects the Discoverable option 602, the method 1700 can proceed to block 1710 and in the event the user selects the Add New Device option 604, the method 1700 can proceed to block 1716.

At block 1710, the Discoverable menu can be displayed. For example, in response to the Discoverable option 602 being selected, the microprocessor 238 can cause the display of the Discoverable menu 802 as shown in FIG. 8. The Discoverable menu 802 can include a No option 804, 2 Minutes option 806, and a Yes option 808. In the event the user selects the No option 804, the method 1700 can proceed to block 1708. In the event the user selects the 2 Minutes option 806, the method 1700 can proceed to block 1712. In the event the user selects the Yes option 808, the method 1700 can proceed to block 1714.

At block 1712, the communication device can be discovered for two minutes. For example, in response to the 2 Minutes option 806 being selected, the microprocessor 238 can allow the communication device 100 to be found by another short range wireless device, but does not require the two devices to be connected. For example, the two devices may not be compatible or the users of the two short range wireless devices may not want to connect. In one or more implementations, the communication device 100 can be discovered for a predetermined time that can be adjusted by the user. After the predetermined time elapses, e.g., two minutes, the microprocessor 238 can terminate the discover feature and the method 1700 can proceed to block 1730.

12

At block 1714, the communication device can activate the discover feature. For example, in response to the Yes option 808 being selected, the microprocessor 238 can allow the communication device 100 to be found by another short range wireless device, but does not require the two devices to be connected. The discover feature can remain on until the user deactivates the feature, e.g., selecting the No option 804 from the Discoverable menu 802. After activating the discover feature, the method 1700 can proceed to block 1730.

At block 1716, the Add Device menu can be displayed. For example, in response to the Add New Device Option 604 being selected, the microprocessor 238 can cause the display of the Add Device menu 902 on the display 222 of the communication device 100 as shown in FIG. 9. The Add Device menu 902 can include the options of Search 904, Listen 906, and Cancel 908. In the event the Cancel option 908 is selected, the method 1700 can proceed to block 1730. In response to the Listen Option 906 being selected, the microprocessor 238 can allow the communication device 100 to be found by other devices. In response to the Search option 904 being selected, the method 1700 can proceed to block 1718.

At block 1718, a search status window can be displayed. For example, in response to the Search option 904 being selected, the microprocessor 238 can initiate a search for short range wireless devices within a range of the communication device 100 and can cause the display of the search status window 1002 as shown in FIG. 10. The search status window 1002 can include a percentage bar 1004 and a Cancel option 908. The percentage bar 1004 can provide an indication of the search status, for example, 75% complete. The search status window 1002 can provide an indication of the number of short range wireless devices that have been discovered during the search, for example, three devices. In the event the Cancel option 908 is selected, the microprocessor can terminate the search and the method 1700 can proceed to block 1730. Upon completion of the search, the method 1700 can proceed to block 1720.

At block 1720, the search results can be displayed. For example, in response to the search being completed, the microprocessor 238 can display a search results window 1102 as shown in FIG. 11. The search results window 1102 can list the devices that have been found during the search and can include a Cancel option 1112. In the event the Cancel option 1112 is selected, the method 1700 can proceed to block 1730. In the event a found device is selected from the list, the method 1700 can proceed to block 1722.

At block 1722, a prompt to enter a passcode is displayed. For example, in response to a found device being selected, the microprocessor 238 can display a prompt asking the user to "Enter A Numeric Passkey" 1202 as shown in FIG. 12. The numeric passkey can be a passcode or password that is associated with a found device. The user can enter the numeric passkey in the prompt 1204. For example, a user can use a physical keyboard or a touchscreen keyboard to enter a numeric passkey in the Enter A Numeric Passkey prompt 1202. After the user enters the passcode, the method 1700 can proceed to block 1724.

At block 1724, a prompt to confirm the entered passcode is displayed. For example, in response to the user entering the passcode, the microprocessor 238 can display a prompt 1302 to confirm the entered passcode 1304 as shown in FIG. 13. As shown in FIG. 13, a confirmation window 1302 is displayed identifying the entered passkey 1304 with a Yes option 1306 or a No option 1308. If the entered passkey 1304 is accurate the user can select the Yes option 1306 and if the entered passkey 1304 is not accurate the user can select

13

the No option **1308**. In the event the user selects the Yes option **1308**, the method **1700** can proceed to block **1726**. In the event the user selects the No option **1308**, the method can proceed to block **1722**.

At block **1726**, a completion window is displayed. For example, in response to the user selecting the Yes option **1208**, the microprocessor **238** can display the completion window **1402** as shown in FIG. **14**. The completion window **1402** can include a message informing the user that the pairing was successful, for example, "Pairing Complete! Headset connected." In addition, the new pairing can be displayed in the list of paired devices, e.g., Smith's Headset **1404** is displayed in the list. The newest pairing **1404** can be highlighted to provide an indication of the new pairing. The newest pairing can include a checkmark showing that the device was added. After displaying the completion window, the method **1700** can proceed to block **1730**.

At block **1728**, a short menu can be displayed. For example, in response to a paired device being selected from a list of paired devices, e.g., from the list shown in FIG. **14**, a short menu **1504** of graphical short context menu can be displayed with a disable option **1506**, an edit option **1508**, and a more option **1510**. In the event the disable option **1506** is selected, the microprocessor **238** can cause the associated paired device to be inactive and the method **1700** can proceed to block **1730**. In the event the edit option **1508** is selected, the microprocessor **238** can allow the user to rename the associated paired device and the method **1700** can proceed to block **1730**. In the event the more option **1510** is selected, the microprocessor **238** can cause a menu listing additional menu options associated with the pairing to be displayed.

At block **1730**, the Toolkit application homepage can be displayed. For example, in response to the completion window **1402** being displayed, the microprocessor **238** can display the Toolkit application homepage as shown in FIG. **16**. As shown, if there is one or more short range wireless devices paired with the communication device **100**, the Toolkit application homepage would display a checkmark in the Bluetooth® icon **1602**. The method **1700** ends at block **1730**.

Exemplary implementations have been described hereinabove regarding the implementation of pairing short range wireless devices with a communication device. Various modifications to and departures from the disclosed implementations will occur to those having skill in the art. The subject matter that is intended to be within the spirit of this disclosure is set forth in the following claims.

The invention claimed is:

1. A communications device comprising:
 - a display;
 - a wireless communication system;
 - a processor communicatively coupled to the display and the wireless communication system; and
 - a non-transitory memory having stored therein instructions which, when executed by the processor, cause the communications device to:
 - render a plurality of icons on the display, wherein at least one icon of the plurality of icons is configured to launch a wireless set-up application associated with the wireless communication system and rendered with a first visual appearance, and wherein the at least one icon's visual appearance is changeable in-position to a second visual appearance after the communication device and an external wireless device are paired, the second visual appearance having the visual properties of the first visual appearance

14

ance and includes a pairing indication selected from a group consisting of a checkmark, icon color change, icon background color change, and icon graying;

in response to activating the at least one icon in the first visual appearance, configure a paired relationship between the communications device and the external wireless device via the wireless set-up application, wherein the wireless set-up application includes rendering a menu to launch a set-up process to configure the paired relationship; and

after configuration of the paired relationship, render, on the display, the second visual appearance of the at least one icon including the pairing indication, wherein the pairing indication indicates that the communications device is paired with the external wireless device and distinguishes the second visual appearance from the first visual appearance of the at least one icon.

2. The communications device of claim 1, wherein another icon of the plurality of icons is configured to launch at least one of an instant messaging set-up application, a social networking set-up application, an email set-up application, and a wireless data exchange set-up application.

3. The communications device of claim 2, wherein a pairing indication associated with the another icon conveys a status of at least one of the instant messaging set-up application, the social networking set-up application, the email set-up application, and the wireless data exchange set-up application.

4. The communications device of claim 1, wherein the instructions further cause the communications device to render a list of external wireless devices paired with the communications device on the display.

5. A method comprising:

rendering, via a processor of a communications device having a display and a wireless communication system, a plurality of icons on the display, wherein at least one icon of the plurality of icons is configured to launch a wireless set-up application associated with the wireless communication system and rendered with a first visual appearance, and wherein the at least one icon's visual appearance is changeable in-position to a second visual appearance after the communication device and an external wireless device are paired, the second visual appearance having the visual properties of the first visual appearance and includes a pairing indication selected from a group consisting of a checkmark, icon color change, icon background color change, and icon graying;

in response to activating the at least one icon in the first visual appearance, configuring a paired relationship between the communications device and the external wireless device via the wireless set-up application, wherein the wireless set-up application includes rendering a menu to launch a set-up process to configure the paired relationship; and

after configuration of the paired relationship, rendering, on the display, the second visual appearance of the at least one icon including the pairing indication, wherein the pairing indication indicates that the communications device is paired with the external wireless device and distinguishes the second visual appearance from the first visual appearance of the at least one icon.

6. The method of claim 5, wherein another icon of the plurality of icons is configured to launch at least one of an instant messaging set-up application, a social networking

15

set-up application, an email set-up application, and a wireless data exchange set-up application.

7. The method of claim 6, wherein a pairing indication associated with the another icon conveys a status of at least one of the instant messaging set-up application, the social networking set-up application, the email set-up application, and the wireless data exchange set-up application.

8. The method of claim 5, further comprising rendering on the display a list of external wireless devices paired with the communications device.

9. A non-transitory, computer-readable storage device having stored therein instructions which, when executed by a processor of a communications device having a wireless communication system, cause the communications device to perform steps comprising:

rendering a plurality of icons on a display of the communications device, wherein at least one icon of the plurality of icons is configured to launch a wireless set-up application associated with the wireless communication system and rendered with a first visual appearance, and wherein the at least one icon's visual appearance is changeable in-position to a second visual appearance after the communication device and an external wireless device are paired, the second visual appearance having the visual properties of the first visual appearance and includes a pairing indication selected from a group consisting of a checkmark, icon color change, icon background color change, and icon graying;

in response to activating the at least one icon in the first visual appearance, configuring a paired relationship

16

between the communications device and an external wireless device via the wireless set-up application, wherein the wireless set-up application includes rendering a menu to launch a set-up process to configure the paired relationship; and

after configuration of the paired relationship, rendering, on the display, the second visual appearance of the at least one icon including the pairing indication, wherein the pairing indication indicates that the communications device is paired with the external wireless device and distinguishes the second visual appearance from the first visual appearance of the at least one icon.

10. The non-transitory, computer-readable storage device of claim 9, wherein another icon of the plurality of icons is configured to launch at least one of an instant messaging set-up application, a social networking set-up application, an email set-up application, and a wireless data exchange set-up application.

11. The non-transitory, computer-readable storage device of claim 10, wherein a pairing indication associated with the another icon conveys a status of at least one of the instant messaging set-up application, the social networking set-up application, the email set-up application, and the wireless data exchange set-up application.

12. The non-transitory, computer-readable storage device of claim 9, wherein the instructions further cause the communications device to perform steps comprising: rendering on the display a list of external wireless devices paired with the communications device.

* * * * *
